

SLA1 Camera Characterization

PSF Candidates in 30s Darks

On May 8, 2024 (UTC) we took various dark exposures with the [QHY42 Pro](#) camera.

As they are read in, the darks are scaled to undo zero padding (divided by 16) and the effect of gain (multiplied by 1.39).

They are then combined into a master dark. The master dark is subtracted from the individual darks.

Then we find pixels that (a) exceed a threshold and (b) are brighter than their four nearest neighbors. These are the “hot pixel leaders.”

Then we cull the hot pixel leaders whose neighbors fall off too sharply using the following quick criterion for non-PSF-shaped regions: any hot pixel leader that has a neighbor <30% of the peak is not a PSF candidate.

Finally, the region around these candidates is displayed.

Notes

The pixels are 1.5x1.5 arcsec. In seeing of FWHM=3 arcsec, the PSF will have a FWHM=2 pixels.

A better criterion to consider implementing later:

Compute the probability that the 5x5 pixels (with >200 e-) could have been drawn from the PSF shape plus Poisson noise. Essentially chi-squared. Normalize perhaps by the peak value set to 1.0, or normalized by total area.

Subtract Master Dark from Darks

```
In [2]: subtracted_darks = [
        subtract_dark(
            dark,
            master_dark,
            data_exposure=dark_exposure_with_ccdproc_units,
            dark_exposure=dark_exposure_with_ccdproc_units,
            scale=False
        )
        for dark in darks
    ]
```

The Routines for Locating Hot Pixel Leaders

As a first cut, we will search for all pixels that exceed some threshold. These are the “hot pixels.”

Then each hot pixel is examined to see if it is the brightest relative to its eight nearest neighbors. If it is, it is added to the list of leaders. (A small bit of tie-breaking code is incorporated.)

```

In [3]: from collections import namedtuple

Pixel = namedtuple('Pixel', 'x y value')
PSFCCandidate = namedtuple('PSFCCandidate', 'center neighbors')

def is_winner_or_tied(candidate_leader, i, j, data):
    return candidate_leader.value >= data[j, i]

def is_leader(candidate_leader, data):
    data_height, data_width = data.shape
    for offset_y, offset_x in [(-1, 0), (0, 1), (1, 0), (0, -1)]:
        j = floor(candidate_leader.y + offset_y)
        i = floor(candidate_leader.x + offset_x)
        if j < 0 or j >= data_height or i < 0 or i >= data_width:
            continue
        if not is_winner_or_tied(candidate_leader, i, j, data):
            return False
    return True

def find_hot_pixel_leaders(data, threshold):
    # first we simply find all the hot pixels
    data_height, data_width = data.shape
    exceedances = data > threshold # an array of true-false values
    values_of_exceedances = data[exceedances]
    exceedance_indices = np.nonzero(exceedances) # a crafty way of getting the indices of the exceedances
    # all of the hot pixels are candidate leaders
    candidate_leaders = np.transpose([exceedance_indices[1], exceedance_indices[0], values_of_exceedances])
    leaders = []
    for i in range(candidate_leaders.shape[0]):
        row = candidate_leaders[i]
        candidate_leader = Pixel(row[0], row[1], row[2])
        if is_leader(candidate_leader, data):
            leaders.append(candidate_leader)
    return leaders

```

Find the Hot Pixel Leaders

Now we classify all the pixels whose values exceed the threshold as hot pixels. From among these, only the ones which are brighter than their four nearest neighbors are declared to be "leaders."

```
In [4]: # there will be a list of leaders for each dark

hot_pixel_leaders_for_darks = [
    find_hot_pixel_leaders(subtracted_dark.data, threshold) for subtracted_dark in subtracted_darks
]
```

The Routines for Finding PSF Candidates

```
In [5]: def is_too_discontinuous(candidate_psf, i, j, data, ratio):
        return data[j, i] < ratio * candidate_psf.value

def is_candidate_psf(candidate_psf, data, ratio):
    data_height, data_width = data.shape
    for offset_y, offset_x in [(-1, 0), (0, 1), (1, 0), (0, -1)]:
        j = floor(candidate_psf.y + offset_y)
        i = floor(candidate_psf.x + offset_x)
        if j < 0 or j >= data_height or i < 0 or i >= data_width:
            continue
        if is_too_discontinuous(candidate_psf, i, j, data, ratio):
            return False
    return True

def find_psf_candidates(leaders, data, ratio):
    candidates = [leader for leader in leaders if is_candidate_psf(leader, data, ratio)]
    return candidates
```

Find the PSF Candidates

```
In [6]: candidates_for_darks = [  
    find_psf_candidates(hot_pixel_leaders, subtracted_darks[k].data, ratio)  
    for k, hot_pixel_leaders in enumerate(hot_pixel_leaders_for_darks)  
]
```

Display the Candidates

```
In [7]: DISPLAY_HALF_RANGE = 3
